

Design Review Reflection for Kyzr

Feedback and Decision

Our feedback was mainly centered around implementation and organization of the database, formatting and obtaining GPS data, and the user experience regarding their torch. We have decided to implement our MongoDB structure that we had originally created. In terms of the GPS data, we will be using Google Maps API because D3 would cause more issues than it would solve, and the Google Maps API integrates well into our project. Additionally, as a possible stretch goal, we may include personalization of the torch, such as pictures or messages, to increase user motivation to use the app.

Review Process Reflection

Overall, the review process went well. We stuck to our agenda really well and had a very interactive audience. We also did not go over our allotted time, which is something that we were worried due to the scope of our project. One of the major feedback items that we received was about the extent to which we described our project. In future design reviews, we will work on this and describe our project and what we're doing from a technical perspective in more detail. This will be helpful given that our entire project is outside of the scope of this class.
